

Sprint #2 Release Demo Self-Grade

Oct 9, 2026 · @Erin Hasani

Summary

Estimated score: **13 of 19** for the code on `dev` at `dbc4283`, but only **8 to 10** if the demo ran on PROD today, because PROD serves nothing. The Scrum board subsection is left for a manual check. The biggest risk is deployment, not code: `main` is 133 commits behind `dev`, and TEST is missing the category work merged on October 9.

Rubric row	Max	Grade for the code	Grade if demoed on PROD today	Deciding factor
Usability	4	3	0	Features work, but rough edges remain and PROD is empty
Sizing and Security	5	5	5	Argon2id or bcrypt (salted); layouts tested at 375-1440 px
Requirements	5	3	3	Stories follow the template, but story 10's tests use jargon
Release	5	2	0-2	Nothing on PROD, 2 open PRs with 0 comments, work with no story

Rerun on 2026-10-09: `tsc` clean, 110 Vitest tests pass (1 `todo`), 84 PHP security and config checks pass, and 162 Playwright tests pass on desktop and mobile Chromium. Playwright mocks the PHP API. TEST and PROD were checked with read-only requests.

What changed since the first review: the category work (cards 39-42, PRs #49-#52) was added and reviewed, and PROD was found to be empty. The Requirements flaw about a missing "so that" clause was removed, because the course template uses "which is confirmed by".

Usability — 3 of 4 (Satisfactory), 0 if demoed on PROD today

The Sprint 2 features work in the build, so the code earns Satisfactory. The rubric has no Exemplary band for this row. PROD serves nothing yet, though, so a demo there would score 0 until `main` is deployed.

Evidence for the grade

- All 162 Playwright tests pass on desktop and iPhone 13 Chromium. That is 22 more than last time, from the category editor and grouping specs.
- Story 114 (delete a note) works from the list and the editor, with a confirmation dialog, a "Note deleted." message, and a "We couldn't open that note" page for dead links.
- Story 10 (categories) works: an editor selector that restores the last saved value if a save fails, grouped headings with counts, and an "All categories" filter that combines with search.
- axe-core reports zero WCAG 2.1 AA violations, and the app supports reduced motion, high contrast and 200% text.

Flaws found

- **Nothing is usable on PROD.** cattle shows an empty folder listing, so a grader can't open the app there.
- **TEST is missing the category feature.** aptitude serves the October 5 build, so a story 10 demo on TEST fails.
- **Grouping breaks the pinning promise.** Notes are grouped by category first and pinned only inside their group, so a pinned Personal note sits below every School note. The README still says pinned notes "stay at the top of every sort".
- **The browser tests never touch the real API.** Every Playwright run logs `ECONNREFUSED 127.0.0.1:8080` because the API is mocked. Only the HTTP suites, run by hand against TEST, prove the real backend.
- **Prototype controls show in the real UI.** The import dialog has a "Prototype preview options" control, and document extraction is simulated.
- **"Category" now means two things.** Courses and events still live only in the browser, and the README says a collaborator sees a shared note's *course* as its category. With School, Work, Meetings and Personal now called categories, that will confuse users.
- **The demo workspace still uses the collaborator mock.** Only `jamie@example.edu` can be invited, and the invitation disappears on reload.
- **Account recovery is unforgiving.** Without the recovery code an account is gone for good, and no email is ever sent.

- **Password rules can surprise users.** Passwords must be printable ASCII, at most 72 characters.

Sizing and Security — 5 of 5 (Exemplary)

The code meets every Exemplary condition: passwords are hashed and salted, and layouts are tested at phone, tablet and desktop widths. The grade only holds if PROD actually serves the app, which it does not today.

Evidence for the grade

- `hashPassword()` in `backend/lib/security.php` calls `password_hash` with Argon2id, or `bcrypt` at cost 12 where Argon2id is unavailable. Both add a random per-password salt stored inside the hash. `password_needs_rehash` upgrades old hashes at login.
- `App.module.css` has breakpoints at 360, 767, 1023, 1250 and 1600 px. The responsive test checks for no sideways scrolling at 375, 768, 1024 and 1440 px and at 200% text, and the suite also runs on an emulated iPhone 13.
- Beyond the rubric: CSRF tokens, `Secure` session cookies, rate limits on signup, login, reset and invites, and a common-password check. The 84 PHP security and config checks pass.

Flaws found

- **The extremes of "all screen sizes" are untested.** No test runs at 320 px (iPhone SE) or in landscape phone sizes such as 844×390. The tightest breakpoint is 360 px.
- **The category headings add height on phones.** Each group heading pushes notes further down, and no test checks the grouped list at 320 px.
- **The accessibility scan covers one page at one size.** axe runs only on the dashboard at 1440 px.
- **No test runs on a real touch device.** Mobile coverage is Chromium emulating an iPhone, not Safari on iOS.
- **The breached-password list is tiny.** `COMMON_PASSWORDS` holds about 50 entries.
- **PROD shows a directory listing.** cattle serves an Apache index of the empty team folder, which tells a visitor directory listings are on. Once the app is deployed, `index.html` hides it, but any folder without an index file will be listed.

Requirements — 3 of 5 (Satisfactory)

Both Sprint 2 stories checked here follow the course template, and the shipped features match their tests. The grade stops at 3 because story 10's acceptance tests can't be run by an untrained user, and some cards describe work the code doesn't do.

The [CSE 442 guidelines](#) give the template as "As a *role*, I want *action* which is confirmed by *observable outcome*". Last version's flaw about a missing "so that" clause was wrong and has been removed.

Evidence for the grade

- Story 114 (delete a note) and story 10 (organize notes into categories) both use "As a ..., I want ..., which is confirmed by ...".
- Story 114's 7 acceptance tests give exact inputs and expected text, and include a phone pass and cleanup.
- Story 10's feature matches its outcome: the notes list groups under School, Work, Meetings and Personal headings with counts, has an "All categories" filter, and rejects bad categories with "Choose a valid category."
- Cards 39–42 each merged with their own tests: `note-categories-http.mjs`, `note-category-filter-http.mjs`, `categories.test.ts`, `note-category-editor.spec.ts` and `note-category-groups.spec.ts`.

Flaws found

- **Story 10's acceptance tests contain developer jargon.** Test 3 says "Seed two School notes", Test 5 says "update the note through the API", and Test 6 says "Simulate a server or network failure". A typical user can't do any of these, which breaks the "no jargon" rule.
- **Story 10's acceptance tests leave out required inputs.** Test 1 says "Sign in" without an address, email or password, and no test gives the site URL.
- **Story 114 Test 7 says "open the PROD address" without giving it.** PROD is currently empty (see Release), so this test can't pass today either.
- **Card 70 still says permissions are stored "via the API".** They live in `collaborators.mock.ts` and are lost on reload.
- **The category task tests may not follow the label rule.** The guidelines want task tests "labeled with the bug they identify", for example "Test 1 - Deleted note is still returned". The local draft for cards 39–42 uses feature names such as "Save and retrieve a valid category", and gives no file locations. Check the board copies.

- **The README promises version history with restore**, while card 56's branch still has an unmerged commit from 2026-10-08.
- **Only stories 10 and 114 were checked word for word.** Check the other Sprint 2 stories on the board against the template.

Release — 2 of 5 (Developing)

The repo side is mostly clean. The deployed side is not: PROD serves nothing, and TEST is 4 days behind `dev`. Satisfactory also needs *all* functionality to come from a story, and unfinished tasks need comments. Both conditions still fail.

What each server serves on 2026-10-09

Server	Branch	What it serves	Gap
PROD (cattle)	<code>main</code>	An empty Apache folder listing; <code>/api/index.php</code> returns 404	Nothing is deployed, not even Sprint 1
TEST (aptitude)	<code>dev</code>	Build dated 2026-10-05; the server notes API answers	Missing cards 39–42 (categories), merged 2026-10-09

Evidence for the grade

- `npm run build` produces the release from tracked files only. The only file kept off the repo is the DB config, which holds credentials and is allowed.
- 43 PRs were merged into `dev`, most named after their card. The only direct commit on `dev` is the first one (2026-09-04), and `main` changes only by PR merge, as the guidelines require.

Flaws found

- **PROD is empty.** Until `dev` is merged into `main` and deployed to cattle, a grader opening PROD sees a bare directory listing. That would zero Usability as well.
- **`main` is 133 commits behind `dev`.** Its last change is the "End of Sprint #1" merge on 2026-09-22.
- **TEST lags `dev`.** The October 5 build lacks category grouping, filtering and the editor selector.

- **Some merged work has no story.** PRs #15-#19 (`fix-aptitude-configuration` , `streamline-signup-settings` , `ascii_security` , `fix-stacked-accents`) have no card number. The security hardening from closed PR #45 was folded into task 120, a deletion card.
- **Unfinished tasks have no explanation.** PR #27 (`106-save-new-note`) and PR #9 (`29-investor-story-account-poc`) are still open with 0 comments.
- **Task branches are unmerged.** `106-save-new-note` , `35-automatically-organize-uploaded-class-notes` , `54-note-search-interface` and `56-store-note-version-history` hold commits that are not in `dev` , with no explanation.
- **Branch clutter has grown.** The remote now has 58 branches, including `codex/107-frontend-edit-note-title` , two `92-*` branches and `120-security-hardening` from a closed PR.

Fixes, most urgent first

Items 1-3 decide whether the demo scores at all. Do them before the sprint ends.

#	Flaw	Row at risk	Fix
1	TEST serves the October 5 build	Usability, Release	Deploy <code>dbc4283</code> to aptitude (no new migration is needed) and run the HTTP suites, including the two category suites
2	PROD (cattle) is empty	Usability, Release	PM merges <code>dev</code> into <code>main</code> by PR, applies migrations 001-004 to cattle's database, then builds and uploads with cattle's own config
3	Open PRs #27 and #9 have 0 comments	Release	Merge them, or close each with a comment explaining the blocker and the steps taken
4	Unmerged branches 106, 35, 54, 56	Release	Merge each, or comment on its card explaining why it is incomplete

#	Flaw	Row at risk	Fix
5	Merged work with no story (PRs #15-#19, security hardening)	Release	Attach each to an existing story, or add a story card that covers it
6	Story 10 tests say "Seed", "through the API", "Simulate a failure"	Requirements	Rewrite them as steps a user can click through, with the URL, email and password
7	Story 114 Test 7 says "PROD address"	Requirements	Replace it with the real cattle URL
8	Pinned notes no longer float above other categories	Usability	Add a "Pinned" group above the category groups, or update the README and the pinning card
9	Card 70 says "via the API" but uses a mock	Requirements	Edit the card to say what shipped
10	Prototype preview control visible	Usability	Hide it behind a URL flag for the demo
11	No 320 px or landscape-phone tests	Sizing	Add 320×568 and 844×390 to the responsive test
12	axe scans one page only	Sizing	Run axe on Notes, the editor and the delete dialog at 375 px
13	58 remote branches, some stale	Release	Delete branches whose PRs are merged or closed
